Goldilocks principle - super short & simple One-line summary: write just enough to let the reader check your reasoning - no missing steps, no obvious repetition.

Quick 3-step checklist to apply it: 1. State clearly what you will prove. 2. Give only the definitions/steps needed to connect $A \rightarrow B$. 3. Remove anything the reader can easily fill in, add anything they can't.

Short example sentence (just-right): "To show $f(n) = n + 1$ is bijective: if $f(a) = f(b)$ then $a + 1 = b + 1$ so $a = b$, and for any y take $x = y - 1$ so $f(x) = y$."
